date: SummerSchool 2019, Curitiba subtitle: "Solution for Exercise 1" --- # Lesson 1: OpenStack Basics

Question: Hypervisors and Virtual Machines

What are the basic tasks of a hypervisor?

A hypervisor (sometimes "virtual machine monitor" or VMM) manages physical hardware and divides it into usually smaller virtual hardware, used by virtual machines. Type-1 and Type-2 hypervisors differ in their location (Type 1 runs on bare metal, Type 2 runs on top of an operating system). Examples: XEN (Type 1), KVM (Type 2 but since part of operating system close to Type 1), VirtualBox (Type 2).

“ +-----+-----+ | | +-----+-----+-----+ | VM | VM | | | | +-----+ | | VM | VM | VM |
| | | | | | | App +-----+-----+ | | | | | Hypervisor | +-----+-----+ +-----+-----+
-+ | Hypervisor (Type 1) | | Operating System | +-----+-----+ +-----+-----+ | | | |
Hardware | | Hardware | | | | +-----+-----+ +-----+-----+
“

What are benefits / drawbacks of using virtual machines compared to physical servers?

- Drawback: Virtualisation costs performance and may lead to resource interference when more than one VM is hosted - Benefit: virtual machine is abstracted from hardware and can be freely moved between hardware

Lesson 2: First Steps with Omistack

Task: Launch your first Instance

Your first instance in Openstack should look like follows:

![First instance in Openstack](imgs/firstinstance.png){ width=90% }

Lesson 3: Install Mediawiki Application

How the setup looks like

The setup looks as follows at the moment: one virtual machine, based on an Ubuntu 14.04 operating system, with an Apache2 web server and a MariaDB database server.

“ +-----+-----+Virtual Machine+-----+ | Ubuntu 14.04 | | +-----+ +-----+
-----+ | + | | | | http://publicIP:80 | Apache2 | | MariaDB | | + | + PHP | | Database | |
“

```

+-----> + Mediawiki +-----> | | | | | | | | Port | | Port | | | TCP 80 | | TCP 3306 | | |
+-----+ +-----+ | +-----+ “

```

The ready Mediawiki installation looks like follows:

![Mediawiki Installation](imgs/mediawiki.png)

Question: One Instance for Database and Application

Pro:

- connection via 127.0.0.1 is fast - Traffic does not leave the host - high bandwidth, low latency

Con:

- Scalability is limited, since database is bound to application - Apache2 and mariaDB have to run on the same node - DB and Web server have different resource demand (CPU vs Memory/Disk)

Alternative:

- Move database to separate host - Connect apache2 via TCP - Scale horizontally by adding more web servers
